

Chiral analysis of Warfarin using a Circular Dichroism Detector

Introduction

Warfarin is an anticoagulant used for the treatment and prevention of thromboembolism such as myocardial infarction. In Japan, warfarin potassium is also used as a medicine. Both the S enantiomer and the R enantiomer of warfarin show different pharmacokinetics and physiological activity.

The Circular Dichroism detector is well known for its high accuracy and selectivity for chiral analysis of compounds that have chromophores close to the chiral center. Both CD and UV signals are measured simultaneously and spectral scanning can be used to optimize the wavelength of interest, which is important in the measurement of chiral compounds. Not only can the CD detector help differentiate between two enantiomers, but it can also distinguish between achiral impurities and enantiomers of interest.
